

8-bit PISO shift register

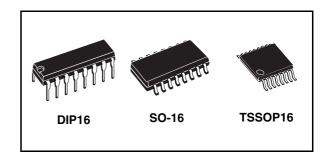

Features

- High speed:
 - t_{PD} = 15 ns (typ.) at V_{CC} = 6 V
- Low power dissipation:
 - I_{CC} = 4 μ A (Max.) at T_A = 25 °C
- High noise immunity: V_{NIH} = V_{NIL} = 28 % V_{CC} (Min.)
- Symmetrical output impedance: II_{OH}I = I_{OL} = 4 mA (Min)
- Balanced propagation delays: t_{PLH} ≅ t_{PHL}
- Wide operating voltage range: V_{CC} (Opr) = 2 V to 6 V
- Pin and function compatible with 74 SERIES 165

The M74HC165 is an high speed CMOS 8 BIT PISO SHIFT REGISTER fabricated with silicon gate C²MOS technology.

This device contains eight clocked master slave RS flip-flops connected as a shift register, with auxiliary gating to provide over-riding asynchronous <u>parallel</u> entry. Parallel data enters when the shift/load input is low.

The parallel data can change while shift/load is low, provided that the recommended set-up and hold times are observed. For clocked operation, shift/load must be high. The two clock input perform identically; one can be used as a clock inhibit by applying a high signal; to permit this operation clocking is accomplished through a 2 input nor gate.

To avoid double clocking, however, the inhibit signal should only go high while the clock is high. Otherwise the rising inhibit signal will cause the same response as rising clock edge.

All inputs are equipped with protection circuits against static discharge and transient excess voltage.

M74HC165 Maximum rating

4 Maximum rating

Stressing the device above the rating listed in the "absolute maximum ratings" table may cause permanent damage to the device. these are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. exposure to absolute maximum rating conditions for extended periods may affect device reliability. refer also to the STMicroelectronics sure program and other relevant quality documents.

Table 3. Absolute maximum ratings

Symbol	Parameter	Value	Unit
V _{CC}	Supply voltage	-0.5 to +7	V
V _I	DC input voltage	-0.5 to V _{CC} + 0.5	V
V _O	DC output voltage	-0.5 to V _{CC} + 0.5	V
I _{IK}	DC input diode current	± 20	mA
I _{OK}	DC output diode current	± 20	mA
Io	DC output current	± 25	mA
I _{CC} or I _{GND}	DC V _{CC} or ground current	± 50	mA

Test circuit M74HC165

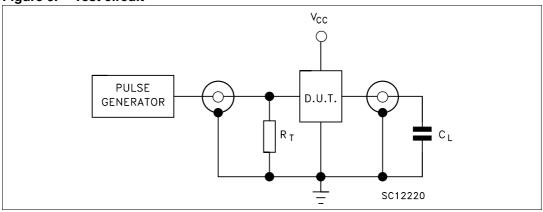

Table 7. Capacitive characteristics

	Parameter	Test condition		Value							
Symbol		V _{CC}		T _A = 25°C			-40 to 85°C		-55 to 125°C		Unit
		(V)	Min.	Тур.	Max.	Min.	Max.	Min.	Max.		
C _{IN}	Input capacitance	5.0			5	10		10		10	pF
C _{PD}	Power dissipation capacitance (1)	5.0			55						pF

C_{PD} is defined as the value of the IC's internal equivalent capacitance which is calculated from the operating current consumption without load. (Refer to Test Circuit). Average operating current can be obtained by the following equation. I_{CC(opr)} = C_{PD} x V_{CC} x f_{IN} + I_{CC}

6 Test circuit

8 Package mechanical data

In order to meet environmental requirements, ST offers these devices in ECOPACK® packages. These packages have a Lead-free second level interconnect . The category of second level interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: www.st.com
